Swiggy Nexus AI — Conversational Commerce Copilot

Document	PRD
Version	1.0
Status	Approved
Owner	Swiggy Nexus AI Team
Audience	Engineering, Product, Design, Reviewers
Last Updated	July 2026

This document is part of the Swiggy Nexus AI reference implementation, an AI-powered personal commerce assistant built on the Swiggy MCP. It captures decisions, requirements, and design intent for engineers, reviewers, and stakeholders.

1. Executive Summary

Swiggy Nexus AI is an AI-powered personal commerce assistant built on the Swiggy Model Context Protocol (MCP). It replaces tap-heavy navigation across Food, Instamart, and Dineout with a single conversational surface that plans, recommends, optimizes, and completes end-to-end commerce workflows. This PRD defines the problem, the target users, the scope of the v1.0 launch, and the success metrics that determine whether we shipped the right thing.

2. Problem Statement

Consumers today spend an average of 7–12 minutes per order across Swiggy verticals due to browsing overhead, coupon hunting, and cognitive load when balancing budget, dietary needs, and delivery time. Multi-person households and repeat purchase patterns (weekly groceries, standing reservations) amplify this friction. Existing UX patterns cannot express intent — they can only display options.

3. Goals & Non-Goals

3.1 Goals

- Reduce median time-to-order across Food, Instamart, and Dineout by at least 60%.
- Deliver a single conversational surface with parity to native Swiggy flows.
- Introduce persistent memory (pantry, preferences, palate) that improves recommendations turn over turn.
- Ship a production-quality open reference implementation for the Swiggy Builders Club.

3.2 Non-Goals

- Building a new payments processor — we reuse Swiggy checkout.
- Supporting merchants; Nexus AI is a consumer-side agent only.
- Offline / voice-only clients in v1.0 (planned for v2.0).

4. Target Users & Personas

Persona	Description	Primary Job-to-be-Done
Busy Professional	25–40, metro, ■8L+ HHI, orders 4–6× / week.	Save time; delegate meal + grocery decisions.
Household Planner	Manages meals for 3+ people with mixed diets.	Coordinate weekly plans within a budget.
Social Diner	Books Dineout 2–4× / month for groups.	Curate quality experiences with minimal effort.
Developer / Builder	Swiggy Builders Club member evaluating MCP.	Fork, extend, and integrate the agent stack.

5. Scope

5.1 In Scope (v1.0)

- Chat surface (web) with SSE streaming.
- Food, Instamart, Dineout workflows via Swiggy MCP.
- Short + long-term memory with user controls.
- Analytics: spend, nutrition, sustainability score.
- OAuth 2.1 + PKCE against Swiggy Identity.

5.2 Out of Scope (v1.0)

- Native iOS / Android apps.
- Multi-user shared conversations.
- Merchant-side tooling.

6. Success Metrics

Metric	Baseline	v1.0 Target
Median time-to-order	6.8 min	≤ 2.5 min
W1 retention (chat users)	—	≥ 45%
Agent task success rate	—	≥ 92%
Cost per successful order (LLM)	—	≤ ₹3.5
NPS	32 (Swiggy app)	≥ 55

7. Functional Requirements (Highlights)

- FR-1: The user shall order food using natural language with dietary, budget, and ETA constraints.
- FR-2: The agent shall assemble a cart and require explicit user confirmation before placing an order.
- FR-3: The system shall persist preferences and expose one-click revocation of memory.
- FR-4: The system shall support at least 40 Swiggy MCP tools with schema-validated I/O.
- FR-5: The system shall stream tokens and tool-call events to the client in real time.

8. Non-Functional Requirements

Attribute	Target
Availability	99.9% monthly
p95 first-token latency	< 1.2 s
p95 full-plan latency	< 4 s
Data residency	India (ap-south-1)
Accessibility	WCAG 2.2 AA

9. Risks & Mitigations

Risk	Likelihood	Mitigation
LLM cost spikes	Medium	Router model + response cache + hard budget caps.
Hallucinated orders	Medium	Never auto-place; require confirmation + schema validation.
MCP rate limits	High	Circuit breaker, backoff, per-tool quota.
Privacy pushback	Medium	Explicit memory controls, encryption, audit log.

10. Release Plan

- Alpha (internal): July 2026 — 50 builders.
- Beta (invite): August 2026 — 2,000 users.
- GA: September 2026 — public open source + hosted demo.
